# Washington Bikes

Michał Syrkiewicz

Loading used libraries. Devtools used to load "R-package" my own small package made for this assignment. "R-package" needs to be present in project folder in order to work.

Reading and saving quarterly data from Washington bikes All needed csv-s in zip folder.

```
Q1 <- read.csv("2013Q1-capitalbikeshare-tripdata.csv")
Q2 <- read.csv("2013Q2-capitalbikeshare-tripdata.csv")
Q3 <- read.csv("2013Q3-capitalbikeshare-tripdata.csv")
Q4 <-read.csv("2013Q4-capitalbikeshare-tripdata.csv")
```

Extracting month and year from every dataset to group by day. Making two separate frames for "Members" and "Casual" users.

```
Q1 <- wyodrebnij(Q1,name="Start.date",from="%Y-%m-%d",what = c("%d","%m")
                 , newName = c("Day","Month"))
Q1 <- Q1 %>% group_by(Day,Month) %>% count(Member.type) %>%
  mutate(Data = paste("2013",Month,Day,sep="-"))
casual <- Q1[Q1$Member.type=="Casual",]
registere <<- Q1[Q1$Member.type=="Member",]
```

```
Q2 <- wyodrebnij(Q2,name="Start.date",from="%Y-%m-%d",what = c("%d","%m")
                 , newName = c("Day","Month"))
Q2 <- Q2 %>% group_by(Day,Month) %>% count(Member.type) %>%
  mutate(Data = paste("2013",Month,Day,sep="-"))
casual1 <- Q2[Q2$Member.type=="Casual",]
registere1 <- Q2[Q2$Member.type=="Member",]
```

```
Q3 <- wyodrebnij(Q3,name="Start.date",from="%Y-%m-%d",what = c("%d","%m")
                 ,newName = c("Day","Month"))
Q3 <- Q3 %>% group_by(Day,Month) %>% count(Member.type)  %>%
  mutate(Data = paste("2013",Month,Day,sep="-"))
casual2 <- Q3[Q3$Member.type=="Casual",]
registere2 <- Q3[Q3$Member.type=="Member",]
```

```
Q4 <- wyodrebnij(Q4,name="Start.date",from="%Y-%m-%d",what = c("%d","%m")
                 , newName = c("Day","Month"))
Q4 <- Q4 %>% group_by(Day,Month) %>% count(Member.type) %>%
  mutate(Data = paste("2013",Month,Day,sep="-"))
casual3 <- Q4[Q4$Member.type=="Casual",]
registere3 <- Q4[Q4$Member.type=="Member",]
```

Merging all data from year 2013

```
casuals<-rbind(casual,casual1,casual2,casual3)
registered<-rbind(registere,registere1,registere2,registere3)
```

Reading and saving weather data from Washington 2013

```
pogoda2013 <- read.csv("2013_DC.csv",skip=3)
```

Small aestethic changes and joining weather and bike data

```
colnames(registered)[4]<- "registered"
colnames(casuals)[4]<- "casual"
registered<- registered[,c(-3)]
casuals<- casuals[,c(-3)]
wynik<- inner_join(casuals, pogoda2013, join_by(Data == time))
wynik <- inner_join(wynik,registered, by=(join_by(Day,Month,Data)))
```

Looking for correlation in data

```
wynik <- wynik[,c(-1,-2)]
wynik<- wynik[,c(2,1,20,3:19)]
correlation(wynik, c(2:3), c(4:20), high=0.65)
```

```
## Sprawdzam 2 i 4
##        temperature_2m_max...C.
## casual                0.716257
## Sprawdzam 2 i 6
##        temperature_2m_mean...C.
## casual                0.6961752
## Sprawdzam 2 i 7
##        apparent_temperature_max...C.
## casual                     0.6939996
## Sprawdzam 2 i 8
##        apparent_temperature_min...C.
## casual                      0.657586
## Sprawdzam 2 i 9
##        apparent_temperature_mean...C.
## casual                      0.6839694
## Sprawdzam 2 i 19
##        shortwave_radiation_sum..MJ.m..
## casual                       0.6778133
## Sprawdzam 2 i 20
##        et0_fao_evapotranspiration..mm.
## casual                       0.7585045
## Sprawdzam 3 i 4
##            temperature_2m_max...C.
## registered               0.6598518
```

As you can see we have high correlation with evapotranspiration, temperature and shortwave radiation. I'll try making new columns with these columns

```
wynik <- wynik %>% mutate(Stosunki1 = temperature_2m_max...C./et0_fao_evapotranspiration..mm.,
                          Stosunki2 = temperature_2m_mean...C./et0_fao_evapotranspiration..mm.,
                          Stosunki3 = apparent_temperature_max...C./et0_fao_evapotranspiration..mm.,
                          Stosunki4 = shortwave_radiation_sum..MJ.m../et0_fao_evapotranspiration..mm.,
                          Inne = shortwave_radiation_sum..MJ.m..*apparent_temperature_max...C.,
                          Inne2 = shortwave_radiation_sum..MJ.m..*temperature_2m_max...C.,
                          Inne3 = shortwave_radiation_sum..MJ.m..*et0_fao_evapotranspiration..mm.)
correlation(wynik,c(2,3),c(4:27),high=0.7)
```

```
## Sprawdzam 2 i 4
##        temperature_2m_max...C.
## casual                0.716257
## Sprawdzam 2 i 20
##        et0_fao_evapotranspiration..mm.
## casual                        0.7585045
## Sprawdzam 2 i 25
##             Inne
## casual 0.7884978
## Sprawdzam 2 i 26
##            Inne2
## casual 0.7948381
## Sprawdzam 2 i 27
##           Inne3
## casual 0.731267
```

As you can see we have higher correlation with products of these columns trying one more time.

```
wynik <- wynik %>% mutate(Inne4 = Inne2 * et0_fao_evapotranspiration..mm.)
correlation(wynik,c(2,3),c(4:28),high=0.7)
```

```
## Sprawdzam 2 i 4
##        temperature_2m_max...C.
## casual                0.716257
## Sprawdzam 2 i 20
##        et0_fao_evapotranspiration..mm.
## casual                        0.7585045
## Sprawdzam 2 i 25
##             Inne
## casual 0.7884978
## Sprawdzam 2 i 26
##            Inne2
## casual 0.7948381
## Sprawdzam 2 i 27
##           Inne3
## casual 0.731267
## Sprawdzam 2 i 28
##            Inne4
## casual 0.7930774
```

Let's plot those columns in order to find more correlation inside data.

```r
p1 <- ggplot(wynik, aes(x = casual, y = temperature_2m_max...C.)) +
  geom_point() + # Add points
  labs(title = "Correlation of casual riders and temperature", # Add title
       x = "Casuals", # Label for x-axis
       y = "Temperature") + # Label for y-axis
  theme_bw()
p2 <- ggplot(wynik, aes(x = casual, y = shortwave_radiation_sum..MJ.m..)) +
  geom_point() + # Add points
  labs(title = "Correlation of casual riders and radiation", # Add title
       x = "Casuals", # Label for x-axis
       y = "Radiation") + # Label for y-axis
  theme_bw()

p3 <- ggplot(wynik, aes(x = casual, y = et0_fao_evapotranspiration..mm.)) +
  geom_point() + # Add points
  labs(title = "Correlation of casual riders and evapotranspiration", # Add title
       x = "Casuals", # Label for x-axis
       y = "Evapotranspiration") + # Label for y-axis
  theme_bw()
p5 <- ggplot(wynik, aes(x = casual, y = Inne)) +
